column representation

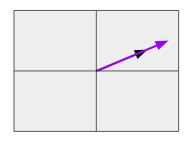

$$\mathbf{v} = \begin{pmatrix} v_1 \\ v_2 \\ \vdots \\ v_N \end{pmatrix} \quad \begin{aligned} &\text{row} \\ &\text{representation} \\ &\mathbf{v}^T = (\begin{array}{cccc} v_1 & v_2 & \dots & v_N \end{array}) \end{aligned}$$

general description

∞-D

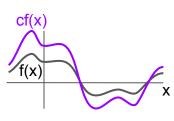

scalar multiplication

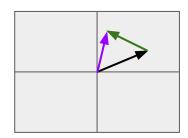

scalar multiplication

$$c\mathbf{v} = c \begin{pmatrix} v_1 \\ v_2 \\ \vdots \\ v_N \end{pmatrix} = \begin{pmatrix} cv_1 \\ cv_2 \\ \vdots \\ cv_N \end{pmatrix}$$

scalar multiplication

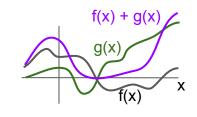

addition

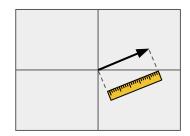

addition

$$\mathbf{v} + \mathbf{u} = \begin{pmatrix} v_1 \\ v_2 \\ \vdots \\ v_N \end{pmatrix} + \begin{pmatrix} u_1 \\ u_2 \\ \vdots \\ u_N \end{pmatrix} = \begin{pmatrix} v_1 + u_1 \\ v_2 + u_2 \\ \vdots \\ v_N + u_N \end{pmatrix}$$

addition

norm

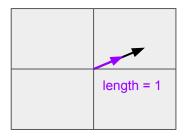

norm

$$\|\mathbf{v}\| = \sqrt{v_1^2 + v_2^2 + \dots + v_N^2}$$

norm

$$||f|| = \int_{x_1}^{x_2} f(x)^2 dx$$

unit vector

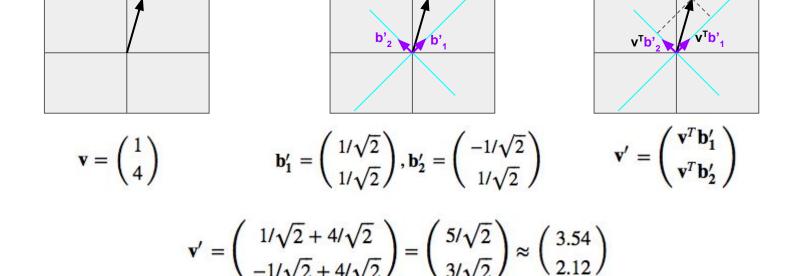

$$\hat{\mathbf{v}} = \frac{\mathbf{v}}{\|\mathbf{v}\|}$$

unit vector

$$f^{unit} = \frac{f}{\|f\|}$$

2-D N-D ∞-D dot (inner) product dot (inner) product dot (inner) product $\mathbf{v} \cdot \mathbf{u} = \langle \mathbf{v}, \mathbf{u} \rangle = \mathbf{v}^T \mathbf{u} =$ $\langle f, g \rangle = \int_{x}^{x_2} f(x)g(x)dx$ $v_1u_1 + v_2u_2 + \cdots + v_Nu_N$ takes in two vectors, returns scalar orthogonality orthogonality orthogonality two vectors are defined to be two functions are defined to be orthogonal if orthogonal if $\langle f,g \rangle = \int_{0}^{x_2} f(x)g(x)dx = 0$ $\mathbf{v} \cdot \mathbf{u} = \langle \mathbf{v}, \mathbf{u} \rangle = \mathbf{v}^T \mathbf{u} = 0$ projection (filtering) projection (filtering) projection (filtering) f(x)feature detection $\hat{\mathbf{v}} \cdot \mathbf{u} = \langle \hat{\mathbf{v}}, \mathbf{u} \rangle = \hat{\mathbf{v}}^T \mathbf{u}$ $\int_{x_1}^{f(x)g(x)} \int_{x_1}^{x_2} f(x)g(x)dx$ ||g|| = 1

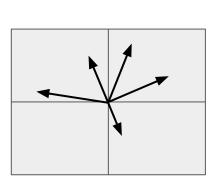

Example: rewrite the following vector in a coordinate system rotated 45 degrees CCW

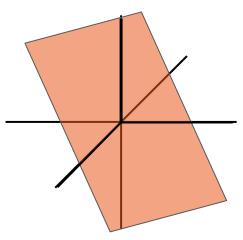

VECTOR SPACES

vectors live in a vector space

one vector space can be a subspace of another vector space

2D vector space

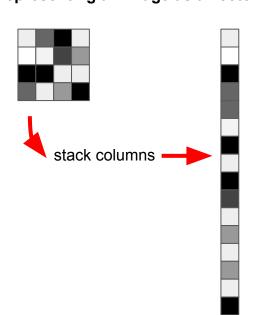

2D vector space as a subspace of a 3D vector space

TIPS AND TRICKS

Always ask:

- Is the quantity I'm working with a scalar? vector? function?
 - If vector: what is dimensionality? what does dimensionality represent?
 what do indices represent? what do elements represent?
 - If function: what is domain of function? what does domain of function represent? what does function argument represent? what do function values represent?

representing an image as a vector

inner product between functions of multiple arguments

$$\int_{x_1}^{x_2} \int_{y_1}^{y_2} f(x, y) g(x, y) dx dy$$

$$\int_{t_1}^{t_2} \int_{x_1}^{x_2} \int_{y_1}^{y_2} f(x, y, t) g(x, y, t) dx dy dt$$

2 x 2

M×N

general description

$$A = \begin{pmatrix} -1 & 2 \\ 2 & -1 \end{pmatrix}$$

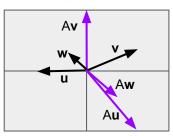

general description

$$A = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1N} \\ a_{21} & a_{22} & \ddots & a_{2N} \\ \vdots & \ddots & \ddots & \vdots \\ a_{M1} & a_{N2} & \dots & a_{MN} \end{pmatrix}$$

$$= \begin{pmatrix} \uparrow & \uparrow & \uparrow & \uparrow \\ \mathbf{a}_{1}^{c} & \mathbf{a}_{2}^{c} & \dots & \mathbf{a}_{N}^{c} \\ \downarrow & \downarrow & \downarrow & \downarrow \end{pmatrix} = \begin{pmatrix} \leftarrow & (\mathbf{a}_{1}^{r})^{T} & \rightarrow \\ \leftarrow & (\mathbf{a}_{2}^{r})^{T} & \rightarrow \\ \leftarrow & \vdots & \rightarrow \\ \leftarrow & (\mathbf{a}_{M}^{r})^{T} & \rightarrow \end{pmatrix}$$

matrix times vector

$$A\mathbf{v} = \begin{pmatrix} -1 & 2 \\ 2 & -1 \end{pmatrix} \begin{pmatrix} 2 \\ 1 \end{pmatrix} = \begin{pmatrix} [-1 \times 2] + [2 \times 1] \\ [2 \times 2] + [-1 \times 1] \end{pmatrix} = \begin{pmatrix} 0 \\ 3 \end{pmatrix}$$

think of a matrix in terms of its actions on a vector space

matrix times vector

$$A\mathbf{v} = \begin{pmatrix} (\mathbf{a}_1^r)^T \mathbf{v} \\ (\mathbf{a}_2^r)^T \mathbf{v} \\ \vdots \\ (\mathbf{a}_M^r)^T \mathbf{v} \end{pmatrix} = v_1 \mathbf{a}_1^c + v_2 \mathbf{a}_2^c + \dots + v_N \mathbf{a}_N^c$$

dot product of each row with **v**or
weighted sum of columns,
weighted by elements of **v**

matrix times matrix

$$AB = \begin{pmatrix} -1 & 2 \\ 2 & -1 \end{pmatrix} \begin{pmatrix} 2 & 3 \\ 1 & -1 \end{pmatrix} = \\ \begin{pmatrix} [-1 \times 2] + [2 \times 1], [-1 \times 3] + [2 \times -1] \\ [2 \times 2] + [-1 \times 1], [2 \times 3] + [-1 \times -1] \end{pmatrix} = \\ \begin{pmatrix} 0 & -5 \\ 3 & 7 \end{pmatrix}$$

 $AB \neq BA$

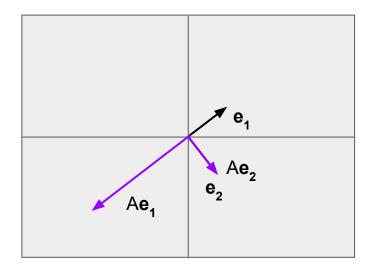

matrix times matrix

$$AB = \begin{pmatrix} (\mathbf{a}_{1}^{r})^{T} \mathbf{b}_{1}^{c} & (\mathbf{a}_{1}^{r})^{T} \mathbf{b}_{2}^{c} & \dots & (\mathbf{a}_{1}^{r})^{T} \mathbf{b}_{P}^{c} \\ (\mathbf{a}_{2}^{r})^{T} \mathbf{b}_{1}^{c} & (\mathbf{a}_{2}^{r})^{T} \mathbf{b}_{2}^{c} & \dots & (\mathbf{a}_{2}^{r})^{T} \mathbf{b}_{P}^{c} \\ \vdots & \ddots & & & \\ (\mathbf{a}_{M}^{r})^{T} \mathbf{b}_{1}^{c} & (\mathbf{a}_{M}^{r})^{T} \mathbf{b}_{2}^{c} & \dots & (\mathbf{a}_{M}^{r})^{T} \mathbf{b}_{P}^{c} \end{pmatrix} = \begin{pmatrix} \uparrow & \uparrow & \dots & \uparrow \\ A\mathbf{b}_{1}^{c} & A\mathbf{b}_{2}^{c} & \dots & A\mathbf{b}_{P}^{c} \\ \downarrow & \downarrow & \dots & \downarrow \end{pmatrix}$$

each column of result is A multiplied by corresponding column of B

2 x 2 N x N

$$A = \begin{pmatrix} -1 & 2 \\ 2 & -1 \end{pmatrix}$$

$$\lambda_1 = -3, \ \lambda_2 = 1$$

eigenvectors of matrix A are vectors that change only length or sign, but not direction, when acted upon by A

$$A\mathbf{e}_1 = \lambda_1 \mathbf{e}_1$$

$$A\mathbf{e}_2 = \lambda_2 \mathbf{e}_2$$

$$\vdots$$

$$A\mathbf{e}_N = \lambda_N \mathbf{e}_N$$

 $A = E\Lambda E^T$

matrix whose columns

columns are eigenvectors

diagonal matrix whose diagonal elements are eigenvalues

MATLAB Code:

[E, L] = eig(A)

E is matrix whose columns are eigenvectors

⊥ is matrix whose diagonals are corresponding eigenvalues

Python Code:

E, L = np.linalg.eig(A)

E is matrix whose columns are eigenvectors

 ${\tt L}$ is 1-D array whose elements are corresponding eigenvalues

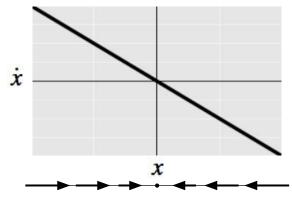

fun facts

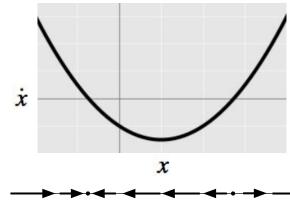

- eigenvalues and eigenvectors of matrix are *invariant* to change of basis.
 - o eigenvalues will be identical
 - o eigenvectors will be same vectors, just rewritten in new coordinates
- if A is symmetric ($A = A^{T}$), then eigenvalues are real and eigenvectors are orthogonal.
- eigenvalues and eigenvectors often have special meaning:
 - o e.g., in PCA related to directions of maximum variance
 - o e.g., in dynamical systems related to system stability

- "dynamical system" = system that changes in time
- represent with system of differential equations
- solving DEs is hard -- what can we learn about system without finding explicit solution?

1D	2D	ND

1D graphical representation

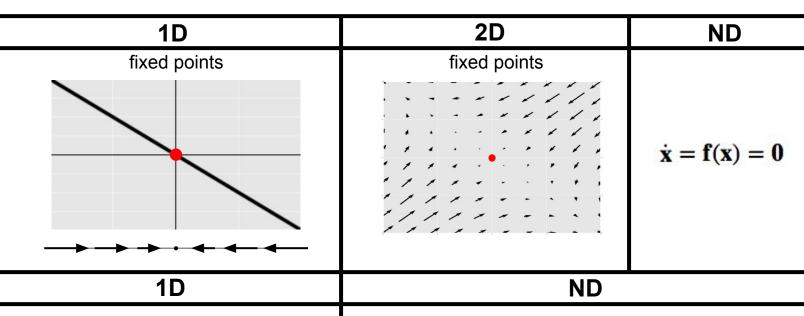

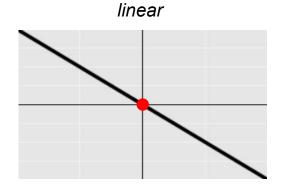

2D graphical representation (phase portrait)

 x_2

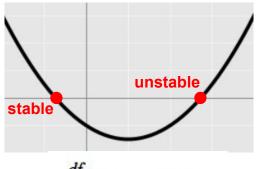

stability analysis

slope > 0: unstable

slope < 0: stable

nonlinear

 $\frac{df}{dx} > 0$: unstable

 $\frac{df}{dx} < 0$: stable

(evaluated at fixed point)

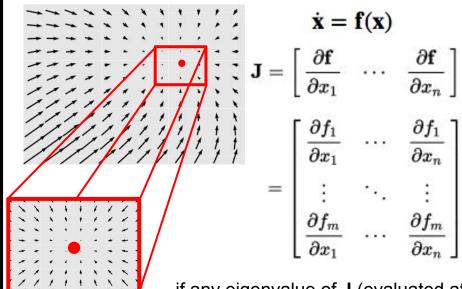

linear

$$\dot{\mathbf{x}} = A\mathbf{x}$$

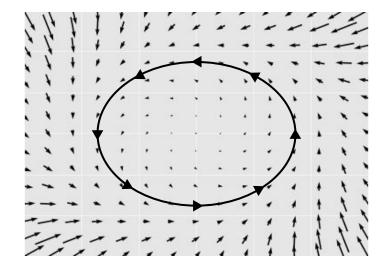

if real part of any eigenvalue of A is greater than 0, fixed point is unstable

nonlinear

if any eigenvalue of **J** (evaluated at fixed point) is greater than 0, fixed point is unstable

limit cycles

strange attractors (chaos)
